## Problem Sheet 2

1. Fix  $S \subset \mathbb{R}$  with an upper bound, and suppose that  $S \neq \emptyset$  and  $S \neq \mathbb{R}$ . Give proofs or counterexamples to each of the following statements.

- (a) If  $S \subset \mathbb{Q}$  then  $\sup S \in \mathbb{Q}$ .
- (b) If  $S \subset \mathbb{R} \setminus \mathbb{Q}$  then  $\sup S \in \mathbb{R} \setminus \mathbb{Q}$ .
- (c) If  $S \subset \mathbb{Z}$  then  $\sup S \in \mathbb{Z}$ .
- (d)  $S \cap \left\{ \frac{n}{m} \in \mathbb{Q} : n, m \in \mathbb{N}, m \leq 10^{100} \right\}$  has a minimum if it is nonempty.
- (e) There exists a max S if and only if sup  $S \in S$ .
- (f)  $\sup S = \inf(\mathbb{R} \backslash S)$ .
- (g)  $\sup S = \inf(\mathbb{R}\backslash S) \iff S$  is an interval of the form  $(-\infty, a)$  or  $(-\infty, a]$ .
- 2. Fix nonempty sets  $S_n \subset \mathbb{R}$ ,  $n = 1, 2, 3, \ldots$  Prove that

$$\sup \left\{ \sup S_1, \sup S_2, \sup S_3, \ldots \right\} = \sup \left( \bigcup_{n=1}^{\infty} S_n \right),$$

in the sense that if either exists then so does the other, and they are equal.

3. Take bounded, nonempty  $S, T \subset \mathbb{R}$ . Define  $S+T:=\{s+t: s\in S, t\in T\}$ . Prove

$$\sup(S+T) = \sup S + \sup T.$$

 $4.* \text{ Fix } a \in (0,\infty) \text{ and } n \in \mathbb{N}. \text{ We will prove } \exists x \in \mathbb{R} \text{ such that } x^n = a. \text{ Set}$ 

$$S_a := \{ s \in [0, \infty) : s^n < a \}$$

and show S is nonempty and bounded above, so we may define  $x := \sup S_a$ .

For  $\epsilon \in (0,1)$  show  $(x+\epsilon)^n \le x^n + \epsilon[(x+1)^n - x^n]$ . (Hint: multiply out.)

Hence show that if  $x^n < a$  then  $\exists \epsilon \in (0,1)$  such that  $(x+\epsilon)^n < a$ . (\*)

If  $x^n > a$  deduce from (\*) that  $\exists \epsilon \in (0,1)$  such that  $(\frac{1}{x} + \epsilon)^n < \frac{1}{a}$ . (\*\*)

Deduce contradictions from (\*) and (\*\*) to show that  $x^n = a$ .

5. Suppose  $0 < q \in \mathbb{Q}$  and  $a \in (0, \infty)$ . Write  $q = \frac{m}{n}$  with  $m, n \in \mathbb{N}$  and define

$$a^q := x^m,$$

where  $x =: a^{1/n}$  is defined in the last question. Show this is well defined, and make a definition of  $a^{-q}$ .

Show that  $(ab)^q = a^q b^q$  and  $(a^{q_1})^{q_2} = a^{q_1 q_2}$  for any  $a, b \in (0, \infty)$  and  $q, q_1, q_2 \in \mathbb{Q}$ .

6. For real numbers x, y, z, consider the following inequalities.

(a) 
$$|x+y| \le |x| + |y|$$

(e) 
$$|x| < |y| + |x - y|$$

(b) 
$$|x+y| \ge |x| - |y|$$

(f) 
$$|x| \ge |y| - |x - y|$$

$$|x+y| \ge |y| - |x|$$

(e) 
$$|x| \le |y| + |x - y|$$
  
(f)  $|x| \ge |y| - |x - y|$   
(g)  $|x - y| \le |x - z| + |y - z|$ 

(a) 
$$|x+y| \le |x| + |y|$$
  
(b)  $|x+y| \ge |x| - |y|$   
(c)  $|x+y| \ge |y| - |x|$   
(d)  $|x-y| \ge ||x| - |y||$ 

 $\mathbf{Prove}$  (a) from first principles. Why is it called the "triangle inequality"? **Deduce** (b,c,d,e,f,g) from (a).
